Prepared by: Product & Engineering Team · March 2025 · v1.0

Executive Summary

IronIQ is a comprehensive gym & fitness platform built for the Indian market. It solves the #1 problem gym-goers face: forgetting previous workout data and losing track of progressive overload. The platform combines intelligent workout tracking, MFP-style diet logging with an Indian food database, AI coaching powered by large language models, progress analytics, gamification, and a community feed.

The Problem	Our Solution
• Gym-goers forget previous sets/reps • No progressive overload tracking • No Indian food database in diet apps • Generic AI advice not based on user data • No app built specifically for Indian lifters	• Session-by-session comparison built-in • Auto progressive overload suggestions • Verified Indian food DB (dal, roti, paneer) • AI coach reads your actual workout history • Hindi + regional language support planned

Tech Stack

Frontend	Backend	Database	AI / ML	Infrastructure
React Native (iOS + Android) React.js (Web)	Spring Boot (Java) REST APIs JWT Auth	PostgreSQL Redis Cache S3 (photos)	Claude API (AI Coach) MediaPipe (Form analysis)	AWS / GCP Docker CI/CD Pipeline

Monetization Strategy

Free	Pro ■	Elite ■
■0 / month	■299 / month	■699 / month
✓ Workout tracking ✓ Split builder ✓ Exercise library ✓ Basic history ✓ Streak tracker ✗ AI Coach ✗ Diet tracking ✗ Analytics ✗ Progress photos	✓ Everything in Free ✓ AI Coach (50 msg/mo) ✓ Full diet tracking ✓ Indian food database ✓ Advanced analytics ✓ Workout templates ✓ PR detection ✗ Form analysis ✗ Adaptive plans	✓ Everything in Pro ✓ Unlimited AI Coach ✓ AI form analysis ✓ Adaptive plans ✓ Priority support ✓ Early feature access ✓ B2B gym dashboard ✓ Coach-client mode ✓ Custom branding

Revenue Projections

Milestone	Users	Pro Conv.	Monthly Revenue	Key Driver
Month 3 (Pro launch)	500 MAU	20% = 100	■29,900	Phase 2 paywall
Month 5	2,000 MAU	15% = 300	■89,700	Diet + AI Coach
Month 8	5,000 MAU	12% = 600	■1.8L	Social + Gamification
Month 12 (Year 1)	15,000 MAU	10% = 1,500	■4.5L+	B2B gym partnerships
Year 2 target	50,000 MAU	8% = 4,000	■12L+	Elite tier + B2B scale

Additional revenue streams: B2B gym partnerships (■5K-20K/gym/month), PT commission marketplace (15-20% cut), supplement affiliate links (8-12%), annual plan discount (■2,499/year).

1

Phase 1 — MVP — Workout Tracker

Solve the core problem: tracking sets, reps, and progressive overload.

2–3 weeks

Goal: Solve the core problem: tracking sets, reps, and progressive overload.

Features

Feature	Description
User Authentication	Login / signup with email + Google OAuth. JWT tokens. Password reset flow.
Training Split Builder	5 preset templates (PPL, Upper/Lower, Bro Split, Full Body, Arnold). Fully customizable days. Add/remove exercises per day. Muscle focus tagging. Rest day toggle. Muscle coverage heatmap.
Workout Session	Start / end session with timestamp. Exercise logging: sets × reps × weight. Previous session shown side-by-side. Tap  to complete sets. Auto rest timer between sets (configurable).
Progressive Overload Engine	If reps >= last session → suggest weight increase (+2.5kg default). Visual indicator for today's target (amber dashed border). PR detection with celebration banner.
Exercise Library	320+ exercises. Name, muscle groups, equipment type, difficulty. Filter by muscle group. Image placeholder per exercise. Search functionality.
Workout History	Full session log. Volume (total kg), set count, duration per session. Exercise breakdown with weights. PR badges on sessions.
Streak Tracker	Daily streak counter with fire animation. Weekly volume bar chart. Total workouts counter.
Offline Mode	All workout data cached locally. Sync on reconnect. Critical for gym WiFi environments.

API Endpoints	Database Tables
---------------	-----------------

• POST /api/auth/register • POST /api/auth/login • GET /api/exercises • POST /api/workouts/start • PUT /api/workouts/{id}/log-set • POST /api/workouts/{id}/end • GET /api/workouts/history • GET /api/splits/{userId} • PUT /api/splits/{userId} • users • exercises • workout_sessions • workout_sets • user_splits • split_days • split_exercises	
Success KPIs ✓ DAU/MAU > 40% ✓ Avg session length > 45 min ✓ D7 retention > 50% ✓ Avg sets logged per session > 15	Risks & Mitigations ■ Offline sync conflicts — use last-write-wins with timestamp ■ Progressive overload may suggest too aggressively — add manual override
Monetization Free — build user base. No paywall yet. Focus on retention.	PM Recommendation Ship this in 3 weeks max. Add streak + gamification hooks from Day 1 — users who earn their first badge in Week 1 retain at 3x the rate. Do NOT over-engineer the backend for Phase 1.

2

Phase 2 — Advanced Workout System

Add smarter gym tools and launch the Pro payroll.

2 weeks

Goal: Add smarter gym tools and launch the Pro payroll.

Features

Feature	Description
Workout Templates	Pre-built programs: Push/Pull/Legs, 5×5 Stronglifts, PHUL, PHAT. User can clone and customize. Template scheduling (auto-assigns to calendar days).
Advanced Rest Timer	Configurable per-exercise. +30s / Skip buttons. Audio alert when rest ends. Haptic feedback on mobile.
PR Detection & Celebration	New PR = animated trophy banner. All-time PR vs recent PR distinction. PR history per exercise. Share PR to community.
Workout Analytics	Weight progress graph per lift (6-month view). Total weekly volume chart. Reps/volume trend. 1RM estimator (Brzycki formula). Body part frequency heatmap.
Exercise Filtering	Filter by: chest/back/legs/shoulders/arms/core. Filter by equipment type. Superset grouping support. Notes per exercise.
1RM Calculator	Auto-calculates estimated 1 rep max from working sets. Shows percentage-based training weights. Tracks 1RM progression over time.

API Endpoints

- GET /api/templates • POST /api/templates • GET /api/analytics/volume • GET /api/analytics/strength/{exerciseId} • GET /api/prs/{userId} • GET /api/analytics/frequency

Database Tables

- workout_templates • template_exercises • personal_records • analytics_cache

Success KPIs

✓ Pro conversion rate > 15% ✓ Analytics page views > 3/session ✓ Template usage > 60% of Pro users

Risks & Mitigations

■ Analytics queries can be slow — pre-compute and cache daily ■ Don't gate too many features — free tier must feel complete

Monetization	PM Recommendation
LAUNCH PRO TIER HERE (■299/mo). Paywall: Analytics, Templates, Advanced timer. Users at Week 5 are highest-intent converters.	The paywall goes here, not Phase 10. A user who's been tracking for 5 weeks and sees their bench progress graph will pay immediately.

3

Phase 3 — Diet System (MFP-style)

Build a MyFitnessPal-quality diet tracker with India-first food database

2 weeks

Goal: Build a MyFitnessPal-quality diet tracker with India-first food database.

Features

Feature	Description
Food Diary (MFP-style)	4 meal sections: Breakfast, Lunch, Dinner, Snacks. Tap to expand/collapse. Calories remaining ring (goal – food + exercise). Macro breakdown strip (Carbs/Fat/Protein). Daily navigation arrows.
Indian Food Database	5,000+ verified Indian foods. Serving units: katori, roti, piece, glass (not just grams). Verified macros for: dal, roti, rice, paneer, sabzi, paratha, idli, dosa, sambar. Crowdsource corrections with voting.
Food Search	Real-time search with filter. Barcode scanner (packaged foods). Recent foods list. My saved meals (custom combos like "standard dinner"). Brand search (Amul, Britannia, Nestle).
Food Detail & Serving	Serving size selector with +/- controls. Multiple unit options (piece, grams, ml, katori). Full nutrition facts panel (calories, carbs, fat, protein, fiber, sodium, vitamins). Auto-recalculate on serving change.
Macro & Calorie Goals	TDEE calculator (height, weight, activity, goal). Custom macro ratios (% or grams). Calorie cycling support (higher on workout days). Weekly calorie budget view.
Nutrition Summary	Today at a glance (eaten/burned/goal/remaining). Macro pie chart with legend. Weekly calorie bar chart. Micronutrient tracking (fiber, sodium, iron, calcium, Vitamin D).
Water Tracker	8-cup visual tracker. Tap cups to fill/unfill. +250ml quick add button. Daily goal setting. Reminder notifications.
Meal Templates	Save frequent meals (pre-workout, post-workout, standard dinner). One-tap log entire meal. Edit template anytime.
Exercise Calories	Log cardio: running, cycling, swimming. Auto-calculate calories burned. Sync with workout sessions. Add to calorie remaining.

API Endpoints

Database Tables

• GET /api/foods/search?q= • GET /api/foods/{id} • POST /api/diary/log • GET /api/diary/{date} • DELETE /api/diary/entry/{id} • GET /api/nutrition/summary/{date} • POST /api/meal-templates • GET /api/meal-templates/{userId} • PUT /api/goals/macros	• foods • food_servings • diary_entries • water_logs • macro_goals • meal_templates • meal_template_items
---	---

Success KPIs	Risks & Mitigations
✓ Food diary entries > 3/day per active user ✓ Indian food searches > 60% of all searches ✓ Macro goal completion rate > 65%	■ Indian food macros are notoriously inaccurate online — need manual verification by nutritionist ■ Barcode scanner requires paid API (Open Food Facts is free but limited for Indian products)

Monetization	PM Recommendation
Pro feature — drives upgrades. Add MuscleBlaze/MyFitness affiliate links in food search results (passive ■8-12% commission).	The Indian food database is your biggest competitive moat over MFP. Hire a part-time nutritionist to verify top-500 Indian foods in Phase 3. Users will switch from MFP for this alone.

4

Phase 4 — AI Coach

Make IronIQ unique: an AI coach that actually knows your history.

3 weeks

Goal: Make IronIQ unique: an AI coach that actually knows your history.

Features

Feature	Description
Personalized AI Chat	Powered by Claude API. Context: full workout history + diet logs + goals + recovery data. Conversation memory within session. Suggested quick prompts. Typing indicator.
Daily Brief on Home Screen	Auto-generated daily insight based on last session. Progressive overload suggestion for today. Nutrition reminder. Recovery status. Shown on home without opening chat.
Progressive Overload AI	Analyzes 6-week trend per exercise. Suggests: +weight, +reps, +sets, or deload. Explains why (e.g. "bench stalled 3 weeks — try deload"). Override with manual input.
AI Diet Recommendations	Cross-references workout type with diet data. "Push Day today — you need 2,400 kcal with 180g protein. You're at 1,840 — add paneer bhurji." India-specific food suggestions.
Wearable Integration	Google Fit / Apple Health sync. Auto-import: heart rate, steps, sleep duration, HRV. Sleep quality used in recovery score. Fatigue detection from patterns.
Recovery Score	Combines: sleep hrs, HRV, days since last session, volume trend, subjective feel (1-5 rating). Score 0-100 shown on home. Influences AI workout recommendations.
Coach Dashboard (B2B)	Personal trainers can manage multiple clients. View all client sessions and progress. Send notes and plan adjustments. Revenue: ■ 2K-5K/trainer/month (B2B tier).

API Endpoints

Database Tables

- POST /api/ai/chat • GET /api/ai/daily-brief/{userId} • GET /api/ai/overload-suggestion/{exerciseId}
- POST /api/wearables/sync • GET /api/recovery-score/{userId} • GET /api/coach/clients/{coachId}

- ai_conversations • ai_messages • recovery_scores • wearable_data • coach_client_relationships

Success KPIs

✓ AI chat DAU > 40% of Pro users ✓ Daily brief open rate > 70% ✓ Elite conversion from Pro > 15%

Risks & Mitigations

■ Claude API costs scale with users — set message limits carefully. 50 msgs/mo at ~\$0.50/msg = \$25/user/mo. Pro at \$299 = healthy margin. ■ AI hallucinations on fitness advice — add disclaimer + validate suggestions against exercise science

Monetization

Pro (50 msg/mo) + Elite (unlimited). Launch Elite tier (\$699/mo) here. Target: 20% of Pro users upgrade to Elite within 30 days.

PM Recommendation

The AI is only as good as the data you feed it. By Phase 4, you have 3+ months of user data. Feed the full history as context. Generic AI advice is useless — history-aware advice is magical.

5

Phase 5 — Progress & Body Tracking

Give users a transformation timeline they can see and be proud of.

1 week

Goal: Give users a transformation timeline they can see and be proud of.

Features

Feature	Description
Body Stats Dashboard	Weight log with trend chart. Body fat % estimator (based on measurements). BMI tracker. All stats with sparkline mini-charts.
Progress Photos	Before/after side-by-side comparison. Auto-date-stamped. Privacy: stored encrypted, never shared without explicit action. Timeline scroll.
Strength Progress Graphs	Per-lift progress over time. 1RM estimation history. Volume progression. Comparative: this month vs last month.
Body Measurements	Chest, waist, arms (L/R), thighs, neck. Add custom measurements. Trend arrows (up/down). Export to CSV.
Monthly Progress Report	Auto-generated PDF summary. Workout count, volume, new PRs. Body stat changes. Milestone achievements. Shareable.

API Endpoints

• POST /api/body-stats • GET /api/body-stats/{userId} • POST /api/progress-photos • GET /api/progress-photos/{userId} • GET /api/strength-progress/{exerciseId} • GET /api/monthly-report/{month}

Database Tables

• body_stats • progress_photos • body_measurements

Success KPIs

✓ Photo upload rate > 30% of Pro users ✓ Body stat logging 2+ times/week > 40% of users ✓ Monthly report share rate > 25%

Risks & Mitigations

■ Photo storage costs on S3 — implement compression (max 1MB per photo) and lifecycle rules (delete after 2 years inactivity)

Monetization	PM Recommendation
Pro feature. Progress photos are the #1 retention driver — users who upload photos churn 4x less. Ship fast (1 week).	Users who take progress photos are your most retained users globally. Make the photo comparison feature emotional and motivating — not clinical.

6

Phase 6 — Smart Training Features

Make the app intelligently adjust training based on recovery and fatigue

2 weeks

Goal: Make the app intelligently adjust training based on recovery and fatigue.

Features

Feature	Description
Muscle Recovery Tracking	Per-muscle-group recovery timer. Based on: days since last trained, volume, exercise type. Traffic light system: green/amber/red. Shown on home dashboard.
Fatigue Detection	Analyzes volume trend over 2-week rolling window. Flags accumulated fatigue when rep quality drops (S3/S4 performance vs S1/S2). Triggers deload recommendation.
Adaptive Workout Plans	Plan auto-adjusts based on: recovery scores, fatigue level, life events (user marks "busy week"). Volume auto-regulates. Never programs undertrained or overtrained muscles.
Deload Week Planner	Auto-suggests deload after 8 weeks or fatigue flag. Deload: 40% volume reduction, same intensity. Auto-schedules and reminds. Post-deload strength increase tracking.
Workout Substitution Engine	If primary exercise not available (no cable machine, no barbell): suggest equivalent. Dumbbell bench → cable fly + DB press. Smart substitution based on muscle overlap.

API Endpoints	Database Tables
- GET /api/recovery/muscle-map/{userId} - GET /api/fatigue-score/{userId} - POST /api/adaptive-plan/generate - GET /api/exercise/substitutes/{exerciseId}	- recovery_tracking - fatigue_scores - adaptive_plans - exercise_substitutions
Success KPIs	Risks & Mitigations
✓ Adaptive plan acceptance rate > 65% ✓ Deload compliance > 50% ✓ Fatigue flag accuracy (user agreement) > 75%	■ Fatigue detection algorithm requires at least 8 sessions to calibrate — show "building your profile" state for new users

Monetization	PM Recommendation
Elite tier feature. Adaptive plans are the #1 reason users pay for Elite over Pro.	Build simple rule-based version first (chest yesterday → back today). Add ML-based fatigue model only after you have enough data (3+ months, 1000+ users).

7

Phase 7 — AI Form Analysis

Video-based form feedback powered by on-device pose estimation.

4–6 weeks

Goal: Video-based form feedback powered by on-device pose estimation.

Features

Feature	Description
Video Upload	Upload 10-30 second clip of squat, deadlift, bench press, OHP. Client-side compression before upload. Progress indicator.
MediaPipe Pose Estimation	On-device pose detection using MediaPipe (free, no GPU cost). Extracts 33 body keypoints per frame. Works on standard smartphone camera. No cloud GPU needed.
Form Analysis Engine	Squat: depth detection (hip crease vs knee), knee cave, forward lean. Deadlift: back angle, hip hinge pattern, bar path. Bench: elbow flare angle, bar path, foot position. OHP: elbow width, core stability.
Form Score & Feedback	0-100 form score per lift. Color-coded overlays on video. Written feedback: "Your squat depth is 78% — aim for 90%+". Improvement drill suggestions. Before/after comparison after 30 days.
Safety & Legal	Injury liability disclaimer (mandatory on first use). "This is educational, not medical advice." No medical claims. Report/flag inappropriate content.

API Endpoints	Database Tables
• POST /api/form-analysis/upload • GET /api/form-analysis/{analysisId} • GET /api/form-analysis/history/{userId}	• form_analyses • form_keypoints • form_feedback

Success KPIs	Risks & Mitigations
✓ Form analysis usage > 40% of Elite users/month ✓ Form score improvement > 15 points after 30 days ✓ NPS from form analysis feature > 70	■ High-risk feature: injury liability. Add legal disclaimer and never use words like "your form is dangerous". Use "we noticed X, consider Y" language. ■ MediaPipe accuracy drops with poor lighting — guide users to film in good light

Monetization	PM Recommendation
Elite tier only. Differentiates IronIQ from all competitors. Use MediaPipe (free/on-device) to eliminate GPU costs.	This is your most technically complex feature. Use MediaPipe Pose (runs on device, free) not cloud GPU inference. Ship as "Beta" first, collect feedback for 4 weeks before full launch.

8

Phase 8 — Community & Social

Create social accountability and network effects.

2 weeks

Goal: Create social accountability and network effects.

Features

Feature	Description
Workout Sharing	Share completed workouts as posts. Auto-format: "Bench Press 90kg × 5 ■ New PR". Workout summary card. Option to share with photo.
Community Feed	Chronological feed of followed users + explore tab. Filter by: PRs only, transformations, challenges. Infinite scroll. Pull to refresh.
Like, Comment, Reactions	Like (♥■), Fire (■), Strong (■) reactions. Threaded comments. @mentions. Push notification on engagement.
Transformation Posts	Before/after photo posts with stats (weight lost, muscle gained). Timeline format. Privacy controls (public/friends/private).
Gym Challenges	Weekly challenges: "Most bench volume", "Longest streak", "Most consistent lifter". Auto-leaderboard. Winner badge. City-based challenges.
Follow System	Follow other users. Suggested follows (similar goals, same city). Mutual following. Block/report functionality.

API Endpoints

• GET /api/feed • POST /api/posts • POST /api/posts/{id}/like • POST /api/posts/{id}/comment • GET /api/challenges • POST /api/follow/{userId}

Database Tables

• posts • post_reactions • comments • follows • challenges • challenge_participants

Success KPIs

✓ DAU feed views > 5/session ✓ Post creation rate > 20% of users/week ✓ Comments per post > 3

Risks & Mitigations

■ Toxic community is fatal to a fitness app. Add moderation from Day 1: report system, keyword filters, human review queue for flagged content. ■ ONLY build this after 5K MAU — a ghost-town feed is worse than no feed

Monetization	PM Recommendation
Engagement driver — reduces churn 30%+. Do NOT build before 5K MAU. Empty feed kills motivation.	Build community only when you have enough users to populate feeds organically. The first 1,000 users should feel like a tight community, not a ghost town.

9

Phase 9 — Gamification & Retention

Increase long-term retention through achievement systems and competition

1 week

Goal: Increase long-term retention through achievement systems and competition.

Features

Feature	Description
XP Points System	Earn XP for: logging workout (+100), hitting PR (+500), completing streak day (+50), logging diet (+30), using AI coach (+20). Level up every 3,500 XP. Level badge shown on profile.
Achievement Badges	First workout, 10 workouts, 50 workouts, 100 workouts. First PR, 10 PRs. 7-day streak, 30-day streak, 100-day streak. First 100kg lift, 2-plate club, 3-plate club. Diet: logged 7 days straight. Community: first post, first PR shared.
Workout Streaks	Visual streak counter with fire UI. Miss a day = streak broken. "Rest day" doesn't break streak. Weekly streak target (e.g. 5/7 days). Best streak record tracked.
Leaderboards	Weekly XP leaderboard. Monthly volume leaderboard. City-based boards. Friend group boards. Your rank highlighted. "Top X%" badge.
Weekly Challenges	Auto-generated weekly challenges. "Log 5 workouts this week." "Hit 3 PRs this month." Bonus XP on completion. Challenge cards on home screen.
Friend Challenges	Challenge a friend: "Who benches more by end of month?" Direct challenge notification. Auto-track and announce winner.

API Endpoints

• GET /api/achievements/{userId} • GET /api/xp/{userId} • GET /api/leaderboard/{type} • GET /api/streak/{userId} • POST /api/challenges/friend

Database Tables

• user_achievements • xp_transactions • streaks • leaderboard_snapshots • friend_challenges

Success KPIs

Risks & Mitigations

✓ D30 retention > 40% (up from baseline 25%) ✓
Users with 30+ day streak > 15% ✓ Achievement
unlock rate > 3/user in first month

■ Gamification can feel cheap if rewards are
meaningless — badges must feel earned, not given
freely ■ Leaderboard can demotivate beginners — add
"most improved" category to reward effort not absolute
performance

Monetization

Retention driver — reduces churn 30%+.
Move streaks and basic badges to Phase
1! Do not wait until Phase 9.

PM Recommendation

CRITICAL: Move streaks and basic badges to Phase 1. Users who
earn their first badge in Week 1 retain at 3x the rate. Gamification is not
a Phase 9 feature — it's a retention foundation.

10

Phase 10 — B2B, Scale & Advanced AI

Enterprise gym partnerships and advanced AI features for scale.

Ongoing

Goal: Enterprise gym partnerships and advanced AI features for scale.

Features

Feature	Description
Gym Admin Dashboard	Gym owner portal: manage all member accounts. View aggregate stats (avg sessions/week, popular exercises, peak times). Export member reports. Bulk invite via gym membership email list.
Personal Trainer Mode	PT manages up to 50 clients. Assign workout plans to clients. View client session logs in real time. Send notes and coaching via in-app message. Client progress side-by-side comparison.
White-label Option	Custom branding: gym logo, color scheme. Custom app name. Gym-specific exercise library. Revenue: █10K-50K/month per gym chain.
Advanced AI Features	AI-generated periodization programs (12-week blocks). Auto-adjusting plans based on competition schedule. Injury prevention flags based on volume spikes. AI diet periodization (bulk/cut/recomp cycles).
Analytics API	B2B API for gym equipment companies (e.g. push exercise data to app automatically). Integration with gym management software (Mindbody, Glofox). Webhook support.
Enterprise Billing	Gym bulk pricing: 100 users = █5K/month, 500 users = █15K/month. Annual contracts. Invoice billing. GST compliance.
AI Form Video Library	Build training dataset from anonymized form videos (with consent). Improve model accuracy over time. Expand to more exercises (currently only 4 major lifts).

API Endpoints	Database Tables
• POST /api/gym/register • GET /api/gym/{id}/members • POST /api/gym/bulk-invite • GET /api/coach/all-clients • POST /api/enterprise/billing • GET /api/b2b/analytics	• gyms • gym_memberships • pt_client_assignments • enterprise_billing • b2b_api_keys

Success KPIs	Risks & Mitigations
✓ First gym partner by Month 6 ✓ PT dashboard: 50+ active trainers by Month 9 ✓ B2B ARR > █12L by Year 2	█ Enterprise sales cycles are long (3-6 months) — start conversations in Month 3 while building █ White-label requires custom deployment pipeline — add DevOps capacity before starting this
Monetization	PM Recommendation
B2B is the highest-revenue segment. One gym chain (50 branches × █10K/month) = █5L/month = 1,667 Pro subscribers. Build toward this from Month 6.	The real ceiling isn't B2C at █299/month — it's B2B gym partnerships at █10K-50K/month. Every gym is a channel to 200-2000 users. Start pitching boutique gyms in Month 3, before Phase 10 is even built.

Development Timeline

Phase	Feature	Timeline	Duration	Monetization Event
1	MVP Workout Tracker	Week 1–3	3 weeks	Free launch — build audience
1+	Streaks & Basic Badges	Week 2–3	1 week	Retention hook from Day 1
2	Advanced Workout + Paywall	Week 3–5	2 weeks	■ LAUNCH PRO (■299/mo)
3	Diet System (MFP-style)	Week 5–7	2 weeks	Pro feature — drives upgrades
5	Progress & Body Stats	Week 7–8	1 week	Pro retention driver
4	AI Coach	Week 8–11	3 weeks	■ LAUNCH ELITE (■699/mo)
6	Smart Training	Week 11–13	2 weeks	Elite differentiator
8	Community (5K MAU+)	Month 4–5	2 weeks	Engagement & virality
7	AI Form Analysis	Month 5–7	5 weeks	Elite-only premium feature
10	B2B Gym Partnerships	Month 6+	Ongoing	■ First gym partner target
9	Full Gamification	Month 5	1 week	D30 retention improvement

Top 5 PM Recommendations

Recommendation	Why it matters
1. Move monetization to Phase 2, not Phase 10.	A user who has tracked 5 weeks will pay. Do not wait 5 months to charge anyone.
2. Move gamification to Phase 1.	Streaks and first badges belong in MVP. Retention is 3x higher for users who earn a badge in Week 1.
3. Build offline mode in Phase 1.	Gyms have bad WiFi. If the app breaks mid-workout, users delete it and never return.
4. Indian food database is your biggest moat.	MFP fails India. Dal, roti, paneer with accurate macros wins the Indian fitness market. Hire a nutritionist to verify top 500 foods.

5. B2B is the real revenue ceiling.

One gym chain at ■10K/month per branch > 3,000 individual Pro subscribers. Start pitching gyms at Month 3 even if Phase 10 isn't built yet.

IronIQ — Building India's #1 Gym App · Product Roadmap v1.0 · March 2025
